You are given a task to integrate an existing React component in the codebase

The codebase should support:
- shadcn project structure
- Tailwind CSS
- Typescript

If it doesn't, provide instructions on how to setup project via shadcn CLI, install Tailwind or Typescript.

Determine the default path for components and styles.
If default path for components is not /components/ui, provide instructions on why it's important to create this folder
Copy-paste this component to /components/ui folder:
```tsx
old-masters-preloader.tsx
"use client"

import * as React from "react"

// Old Masters Preloader
//
// A preloader staged like a classical diorama. The wordmark is the loader:
// it stands in the middle of a black stage as hairline outlines and fills
// with marble from the bottom as the load climbs, inside a slowly turning
// Greek meander. At 100 the stage floods with colour, the word settles to the
// floor, and a cast of statues rises out of the dark in front of it, each on
// its own depth: the photographs are keyed off their black grounds by their
// own luminance (an SVG mask, no cutouts), graded as a two-ink print, lit by
// volumetric shafts and drifting dust. The landing is live: the whole scene
// tilts and parts under the pointer, the nearest figure leans in, letters
// hollow under the cursor, a scroll lifts the stage off the page beneath.
//
// React is the only import. Faces arrive through an injected Google Fonts
// <link> (fontHref={null} loads nothing). Every image is a prop.

```
export default function Demo() {
  return (
    <OldMastersPreloader
      figures={[
        { src: APOLLO, alt: "The Apollo Belvedere, a cloak over one arm", x: 58, y: 100, h: 84, depth:
1 },
        { src: HERCULES, alt: "The torso of a marble Hercules", x: 24, y: 103, h: 90, depth: 1.25 },
        { src: FLOWERS, alt: "A marble figure holding flowers", x: 88, y: 100, h: 100, depth: 0.75,
flip: true, phone: false },
      ]}
      backdrop={DAVID}
      fontHref={null}
    />
  )
}
```

Implementation Guidelines
1. Analyze the component structure and identify all required dependencies
2. Review the component's argumens and state
3. Identify any required context providers or hooks and install them
4. Questions to Ask
- What data/props will be passed to this component?
- Are there any specific state management requirements?

- Are there any required assets (images, icons, etc.)?
- What is the expected responsive behavior?
- What is the best place to use this component in the app?

Steps to integrate

0. Copy paste all the code above in the correct directories
1. Install external dependencies
2. Fill image assets with Unsplash stock images you know exist
3. Use lucide-react icons for svgs or logos if component requires them
